

Project Disease Formal Requirements

I. Format

- **The project must be submitted and developed entirely as a GitHub repository.** This means all files, figures, tables and content that will be presented **must** be progressively added to the repository as your project develops. On top of the content already covered in class, you can find detailed instructions on creating and using a GitHub repository [here](#).
- **Name your repository as GroupName_DiseaseName_IB_2026** (where GroupName is your assigned group name and DiseaseName is a shortened name for your disease, e.g. LYZ)
- **The required file format for the Main Project Report file is a markdown document (".md") or any other Github-native format such as HTML.** Other formats (e.g. Google docs, Microsoft Office Word, Apple Pages, etc.) are not acceptable.
- **The structure and style of the Main Project Report must follow the same format as journal manuscripts of BMC Bioinformatics** that is provided to your team via Moodle. You can find the details of the exact length, content, sections and requirements in the BMC Template Bioinformatics file.
- **Your development must be tracked via GitHub commits.** Clear documentation messages during commits will be positively rewarded within reason and use branching as needed if applicable.
- **When someone in the team has made a contribution, commit it.** A scenario where all documents and changes are committed once or very few times before the mid-term delivery deadline will be heavily penalized.
- **The contribution is expected to be from all team members.** A scenario where only a single team member has made all the contributions to the repository will severely penalize the team as a whole.

II. Minimum expected content

The project repository must contain, at least, the following parts:

1. **report/ Main Project Report** which is your bioinformatic research that answers the project's goal
2. **status/ The live Project Status Document** which is detailed after in this document and will be discussed on the retrospective of October 22nd.
3. **gantt/ The Gantt chart** first version that was delivered on October 9th and the updated version at the end of the project.
4. **references/ A references folder** containing all articles and documents used as information sources during project development (can include printed web pages of relevance, PDFs are preferred).

III. Project Status Document

A live document will need to be maintained detailing the project phases and tasks, alongside the person(s) responsible for their development. Next to the justification of its state if applicable. The expected format is, for example:

Task tracking made-up example - Updated up to 07.10							
Task	Resp.	Plan. Start Date	Plan. Finish Date	Real Start Date	Real Finish Date	Status	Notes
1 Get the recipe for the croissants	Nuria	01.08	01.09	01.08	02.08	Canceled	No need, Nuria had her family recipe already
2.1 Buy the ingredients	Ricard	02.09	12.09	03.09	15.09	Completed	Took longer because the store went out of the special flour for the recipe
2.2 Bake the croissants at UPC cafeteria	Nuria and Ricard	02.09	30.09	16.09	05.10	Incident	UPC cafeteria couldn't borrow their oven, found a workaround
3.1 Taste the croissants	Ricard	01.10	09.10	06.10		In progress	First taste went fine, but they need more butter
3.2 Buy supermarket croissants	David	10.10	12.10			Backlog	Contingent plan just in case
3.3 Invite all the students to croissants	All	05.10	15.10			Pending	Waiting for the tasting

IV. Gantt chart

A Gantt chart will be reviewed at two times during project development:

1. From the version delivered by October 9th.
2. At the final delivery due date, reflecting the actual development of the project.

For this reason, the repository should contain a Gantt chart frozen by October 9th and a second Gantt chart which is maintained live all the way until project delivery.
